

Carex solandri

COMMON NAME

forest sedge, Solander's sedge

SYNONYMS

Carex dissita Boott var. *solandri* (Boott) Kük.

FAMILY

Cyperaceae

AUTHORITY

Carex solandri Boott

FLORA CATEGORY

Vascular – Native

ENDEMIC TAXON

Yes

ENDEMIC GENUS

No

ENDEMIC FAMILY

No

STRUCTURAL CLASS

Sedges

NVS CODE

CARSOL

CURRENT CONSERVATION STATUS

2012 | Not Threatened

PREVIOUS CONSERVATION STATUSES

2009 | Not Threatened

2004 | Not Threatened

DISTRIBUTION

Endemic. North, South and Stewart Islands

HABITAT

Coastal to montane. Usually in riparian forest where it may be the dominant sedge of alluvial terraces, and riversides but also colonising wet seepages and slip scars. Usually found in association with *C. dissita* Boott.

FEATURES

Dense yellow-green tufts, upper part of leaves and culms drooping. Culms 0.10–1.00 m long, c.1 mm diameter, trigonous, smooth; basal sheaths red-brown, red-purple to black. Leaves < or = culms, 1.5–6.5 mm wide, linear, double-folded, cartilaginous. Inflorescence of 5–10 distant spikes 10–50 mm long, nodding on long filiform peduncles; terminal 1–4 spikes male, slender, usually approximate; remaining spikes female with a few male flowers above or below, 3–4 mm diameter, usually almost black, lowermost spikes often compound; subtending bracts leafy, > inflorescence. Glumes (excluding awn) ± = or < utricles, ovate, lanceolate, entire or rarely emarginate, light or dark brown, membranous, midrib produced to a scabrid awn of varying length. Utricles 2–3 mm long, slightly > 1 mm. diameter, plano-convex, unequally biconvex or subtrigonous, fusiform or ovoid, turgid, dark red-brown to almost black, occasionally light brown, pale yellow towards the base, surface smooth, occasionally faintly nerved at the base, shining; scarcely narrowed above to a bidentate beak < 0.5 mm. long, margins smooth or occasionally scabrid, orifice us. scabrid; rarely contracted to a stipe c.0.2 mm. long. Stigmas 3. Nut c.1 mm. long, trigonous, obovoid, cream, surface minutely but deeply pitted giving angles of nut a serrate appearance.

SIMILAR TAXA

Carex solandri is most often confused with *C. dissita* Boott, especially as both species often grow together. *Carex dissita* differs from *C. solandri* by the distant, dark brown, rather short and stout, usually shortly pedunculate female spikes. Further, the utricles are also distinctly bicoloured basally cream to yellow brown and red-purple to black above. *C. solandri* has long filiform peduncles and uniformly dark coloured utricles (rarely light brown and pale yellow near the base).

FLOWERING

August - December

FRUITING

October - May

LIFE CYCLE

Nuts surrounded by inflated utricles are dispersed by granivory and wind (Thorsen et al., 2009).

PROPAGATION TECHNIQUE

Easily grown from fresh seed and by division of established plants. A popular species in cultivation, and often sold incorrectly as *C. dissita*. Prefers a permanently damp, semi-shaded site but once established can tolerate full sun and dry spells.

ETYMOLOGY

carex: Latin name for a species of sedge, now applied to the whole group.

solandri: Named after Daniel Carlsson Solander (19 February 1733 - 13 May 1782) who was a Swedish naturalist and an apostle of Carl Linnaeus.
