

# Geranium socolateum

## FAMILY

Geraniaceae

## AUTHORITY

*Geranium socolateum* Heenan et Molloy

## FLORA CATEGORY

Vascular – Native

## ENDEMIC TAXON

Yes

## ENDEMIC GENUS

No

## ENDEMIC FAMILY

No

## STRUCTURAL CLASS

Herbs - Dicotyledons other than Composites

## INTERIM CONSERVATION STATUS

2019 | Threatened – Nationally Critical | Interim

## BRIEF DESCRIPTION

A geranium of limestone habitats. Similar to *Geranium brevicaule* but differing by the more robust growth habit, longer petiole, larger leaves; these usually grey-green to light grey in colour and with a prominent brown margin up to 3.0 mm wide, and by the larger sepals and petals.

## DISTRIBUTION

Endemic. South Island, South Canterbury and North Otago.

## HABITAT

A species of open, sparsely vegetated, stable to semi-stable rocky limestone outcrops and associated colluvium, in a range of aspects, including open and sunny or sheltered and shaded. Also found growing amongst open prostrate shrubs and tussock grasses.

## SIMILAR TAXA

*Geranium microphyllum* sens. lat. (including plants from Subantarctic Islands, South Island and North Island) differs from *G. socolateum* by its longer, slender, trailing stems (up to 40 cm long), open, loose, straggly growth habit; by the lack of short and compact stems and by the leaves which are broader than long, thinner and distantly placed on trailing stems. Further the basal leaves are not persistent, the inflorescences bear several flowers, and these have smaller diameters (8–10 mm across) with smaller petals (6.0–9.0 mm long). *Geranium brevicaule* differs from *G. socolateum* by its more compact growth habit, smaller leaves (usually up to 20 mm diameter), polymorphic leaf colour (green, bronze, purple) but not grey-green to light grey in colour, and by its smaller sepals (4.0–7.0 mm long) and petals (5.0–7.0 mm long).

## FLOWERING

Nov–

## FLOWER COLOURS

White

## FRUITING

Not known

## PROPAGATION TECHNIQUE

Not known from cultivation.

## THREATS

Heenan & Molloy (2019) note that the total population of *Geranium socolateum* is fewer than 1,000 individuals, with the species occurring in widely scattered populations comprising a few plants. The authors note severe habitat competition from naturalised plants, and the lack of suitable habitat for recruitment suggesting that populations are declining. They recommended that *G. socolateum* be assessed as 'Threatened / Nationally Critical' (Criterion "B" due to the small population with a moderate ongoing or predicted decline of 50–70%). Two subcriteria also apply: (B1) 250–1000 mature individuals and (B3) total area of occupancy  $\leq$  10 hectares (see Townsend et al. 2008).

## ETYMOLOGY

**geranium:** From the Greek geranos 'crane', the fruit of the plant resembling the head and beak of this bird, hence the common name cranesbill.

**socolateum:** Chocolate i.e. 'chocolate' colouration
