Gunnera x cryptica

COMMON NAME

Brazilian giant-rhubarb; giant rhubarb

FAMILY

Gunneraceae

AUTHORITY

Gunnera x cryptica J.M.H.Shaw

FLORA CATEGORY

Vascular - Exotic

STRUCTURAL CLASS

Herbs - Dicotyledons other than Composites

CONSERVATION STATUS

Not applicable

BRIEF DESCRIPTION

Giant rhubarb-like herb to 4 m wide or more, dying back to the large creeping stems over winter, with huge prickly leaves on erect petioles up to 2.5 m tall and large sausage-like flower spikes up to 1 m tall with tiny flowers and fruit covering the spike. The photos on this page that bear text boxes with 'G. manicata' should be interpreted as meaning 'Gunnera x cryptica'.

HABITAT

In cultivation requires wet conditions - pond and stream margins, bogs. Seedlings sometimes appear near planted plants in NZ but have been seen 'escaped' in e.g. the Isle of Mull in 2013 (pers.obs. C C Ogle)

DETAILED DESCRIPTION

Giant, clump-forming, gynomonoecious, summergreen herb, with short, stout, horizontal rhizomes. Winter resting buds massive, to about 25cm long. Lvs to about 2.5 m high, rhubarb-like, but rough to the touch. Petiole to 1m long, studded with conic, short, often reddish, prickles. Inflorescence spike-like and up to 1 m long, with very small flowers. small round orange fruit 1.5-2 mm long.

SIMILAR TAXA

Very similar superficially to the much more common adventive and garden species, *G. tinctoria*. In the field the most obvious differences are the long narrow flower spikes of *Gunnera* x *cryptica* cf. the short thick spikes of *G. tinctoria*. The slender radiating inflor. branches are 9.5-11 cm long in *Gunnera* x *cryptica* cf. the thicker branches 4-7 cm X 5-7 mm in central part of panicle (Webb et al.1988). In *Gunnera* x *cryptica*, the upper leaf surface is dull green, not shiny; not or only slightly rugose or bullate (much flatter than in *G. tinctoria*); spines as for *G. tinctoria*, but much less prominent; whole surface somewhat rough but not harsh to touch. In *G. tinctoria* the upper leaf surface is dark green, somewhat shiny; markedly rugose and bullate; raised 'islands' between the veins bearing prominent blunt green spines with bulbous bases; sunken veins with sparse blunt yellow spines; whole surface very harsh to touch like coarse sandpaper. Separation of the two taxa in seedling stages seems barely possible.

FLOWERING

Flowering spikes longer and narrower than in G. tinctoria (see above)

FLOWER COLOURS

Green, Red/Pink

FRUITING

Each spike is capable of producing

LIFE CYCLE

As at 2016, *Gunnera* x *cryptica* ppears to produce seedlings infrequently in the wild and even in gardens, cf. *G. tinctoria* which can be prolific and a major invasive species in NZ indigenous plant communities.

PROPAGATION TECHNIQUE

seed; division of rhizome.

YEAR NATURALISED

2003

ORIGIN

Southern Brazil

REASON FOR INTRODUCTION

Ornamental

ETYMOLOGY

gunnera: Named after Bishop Gunner, a Swedish botanist

Shaw et al. (2022) have shown that all known plants in cultivation outside of Brazil, and which were previously named as *G. manicata*, are actually hybrids between that species and *G. tinctoria*
