Lepidium crassum

COMMON NAME thick-leaved scurvy grass

SYNONYMS None (first described in 2013).

FAMILY Brassicaceae

AUTHORITY Lepidium crassum Heenan et de Lange

FLORA CATEGORY Vascular – Native

ENDEMIC TAXON Yes

ENDEMIC GENUS No

ENDEMIC FAMILY No

STRUCTURAL CLASS Herbs - Dicotyledons other than Composites

CURRENT CONSERVATION STATUS

2017 | Threatened – Nationally Endangered | Qualifiers: CD, DP, EF, RR

PREVIOUS CONSERVATION STATUS

2012 | Threatened – Nationally Endangered | Qualifiers: CD, DP, EF, RR

BRIEF DESCRIPTION

Perennial, strongly aromatic (smelling of cress) herb arising from stout tap-root. Plants with numerous, densely packed leafy branches. Leaves dark green, margins finely serrated, often doubly so. Inflorescences at branch tips, Flowers white with four stamens. Fruits circular, apices rounded or slightly notched, splitting cleanly into two valves, seeds brown or orange-brown.

DISTRIBUTION

Endemic. New Zealand (South Island - historically upper Waitaki, otherwise easterly from Oamaru south to Otago Peninsula)

HABITAT

Coastal headlands and rocky outcrops where it grows in disturbed open areas and among coastal herbfield. Also recorded from man made structures such as the Mole at Aramoana.

DETAILED DESCRIPTION

Tap-rooted, strongly pungent smelling, perennial herb. Growth habit dense, stems closely placed, up to 0.5m tall, arising from underground woody stems. Stems upright to spreading, stout, short, rigid; mature stems woody, $100-400 \times 10-12$ mm, often devoid of foliage on middle and lower parts of stems, new stems $50-200 \times 4-5$ mm, leafy, glabrous. Leaves glabrous, coriaceous, green, undulate, rosette and stem leaves usually withering, variable in size and shape. Leaves of young and vigorous plants and stems: lamina 50–90 × 17–35 mm, broadly elliptic, elliptic to obovate; apex obtuse to truncate, often with up to 3 or 4 teeth; margin singly or doubly crenate, with 15–32 pairs of teeth; teeth up to 3.5 mm deep, sometimes overlapping, often protruding beyond leaf outline; base cuneate, petiole usually distinct; petiole up to $35.0 \times 3.0-6.0$ mm, channelled. Leaves of mature plants and cauline stems: lamina 15-45 × 6-15 mm, broadly elliptic, elliptic-obovate to obovate-oblong; apex obtuse to truncate, often with up to 3 or 4 teeth; margin singly crenate in upper half, teeth often protruding from leaf outline, with 5–10 pairs of teeth; teeth up to 1.2 mm deep, not overlapping, often protruding beyond leaf outline; base cuneate, sometimes narrowly so, usually tapering to ± distinct petiole; petiole 5-12 × 1.6-2.3 mm, channelled. Inflorescence terminal and lateral, racemose, 15–60 mm long, rachis 0.7–1.2 mm diameter, glabrous; pedicels 4–7 mm long, erecto-patent, glabrous. Flowers 4.0–5.0 mm diameter. Sepals 4, 1.3–1.6 mm long, saccate, overlapping at base, green, apex obtuse, margin white, shape dimorphic; lateral sepals broad, 1.4-1.5 mm diameter, orbicular, abaxial surface often hairy, hairs 0.2–0.5 mm long; median sepals narrow, 1.0–1.3 mm diameter, broadly elliptic, glabrous. Petals white, 1.8–2.0 × 1.0–1.1 mm, spreading, claw 0.6–0.8 mm long; limb broadly elliptic to orbicular, apex obtuse to rounded. Stamens 4; filaments 1.2–1.6 mm long, base 0.4–0.5 mm diameter, equal; anthers 0.4–0.6 mm long. Ovary 1.0–1.6 × 0.9–1.1 mm, broadly ovate to broadly elliptic, green to green-brown, apex round or sometimes weakly shouldered; style 0.15–0.3 mm long, cylindrical; stigma 0.2–0.4 mm diameter. Nectaries 4, 0.2–0.3 × 0.1–0.15 mm, oblong to oblongtriangular, green. Silicles cartilaginous when fresh, coriaceous when dry, $3.0-3.7 \times 2.6-3.1$ mm, orbicular to orbicular-rhomboid, apex obtuse to shallowly notched, valves pale brown, glabrous, not winged; style 0.2–0.3 mm long, exserted. Seeds $1.6-1.7 \times 0.9-1.1$ mm, narrowly ovoid, brown to orange-brown, not winged.

SIMILAR TAXA

Lepidium crassum differs from the related L. oleraceum by its usually much smaller stature and seasonal growth habit (with plants dying back to a basal rosette overwinter). Lepidium crassum has distinctly petiolate, uniformly broadly elliptic, elliptic to obovate, thickly coriaceous, often doubly crenate leaves with obtuse to truncate apices. Its silicles are usually orbicular, sometimes orbicular-rhomboid, and with obtuse to shallowly notched apices. DNA sequence data places L. crassum with L. aegrum, L. juvencum and L. seditiosum, a clade sister to L. oleraceum (see de Lange et al. 2013).

FLOWERING

December - March

FRUITING

January - July

PROPAGATION TECHNIQUE

Easily grown from fresh seed but often difficult to maintain in cultivation. Susceptible to a wide range of diseases and pests.

THREATS

Lepidium crassum is virtually confined to the Otago Peninsula though historically it ranged from the upper Waitaki River and Oamaru south to the Catlins Coast. It is estimated that there are less than 1000 plants left in the wild, of which thelargest population numbers about 300 plants (see de Lange et al. 2013). The few remaining populations are extremely vulnerable to stochastic events.

ETYMOLOGY

lepidium: Scale-shaped (pods) **crassum**: Thick
