

# Prumnopitys taxifolia

## COMMON NAME

mataī, black pine

## SYNONYMS

*Dacrydium taxifolium* Banks et Solander ex D.Don in Lamb., *Dacrydium mai* A.Cunn., *D. mayi* Houtte. ex Gord., *Podocarpus matai* Lamb. Ex Hook.f., *Prumnopitys spicata* Kent in Veitch, *Stachycarpus spicatus* (Mirbel) Masters, *Podocarpus taxifolia*

## FAMILY

Podocarpaceae

## AUTHORITY

*Prumnopitys taxifolia* (D.Don) de Laub.

## FLORA CATEGORY

Vascular – Native

## ENDEMIC TAXON

Yes

## ENDEMIC GENUS

No

## ENDEMIC FAMILY

No

## STRUCTURAL CLASS

Trees & Shrubs - Gymnosperms

## NVS CODE

PRUTAX

## CHROMOSOME NUMBER

2n = 38

## CURRENT CONSERVATION STATUS

2017 | Not Threatened

## PREVIOUS CONSERVATION STATUSES

2012 | Not Threatened

2009 | Not Threatened

2004 | Not Threatened

## DISTRIBUTION

Endemic. North Island, South Island and Stewart Island/Rakiura (uncommon).

## HABITAT

Lowland forest. Often in drier climates, where it can dominate alluvial soils which are waterlogged/flooded in winter and dry in summer. Seems to prefer base-rich substrates and soils.

## DETAILED DESCRIPTION

Dioecious conifer 25–(30) m tall. **Trunk** 1–2 m diam. **Bark** dark brown (almost black), falling in thick circular flakes, leaving a distinctive hammer-like scar patterning on trunk. **Wood** dark brown to rich yellow-brown, very hard. **Juveniles** filiramulate, with distinctive, dark brown, slender, flexuous, divaricating branchlets. **Leaves** of juvenile plants brown, pale yellow, or dirty white, 5–10 × 1–2 mm, linear-lanceolate, apex acute; adult leaves dark green, somewhat glaucous above, glaucous below, 10–15 × 1–2 mm, subdistichous, linear, straight to subfalcate, obtuse, often apiculate. **Male cones (strobili)** in spikes, 30–50 mm long, with 10–30 cones per spike. **Ovules** on short axillary branches, 3–10 per 40 mm long spike. **Fruit** a fleshy, oily, aromatic, terpene-tasting, purple-black drupe with a glaucous bloom. **Stone** more or less circular (5.5)–6–8.5 mm diam., surface dull to semi-glossy, pale orange-yellow to light orange-yellow.

## SIMILAR TAXA

Easily recognised by the distinctive filiramulate divaricating juvenile to subadult growth form, charcoal grey hammered bark, dark green to glaucous adult foliage, spicate male cones, and by the ovoid, plum-coloured drupes.

## FLOWERING

(October)–November–February

## FLOWER COLOURS

No flowers

## FRUITING

Fruits take 12–18 months to mature. Ripe fruits may be found throughout the year.

## PROPAGATION TECHNIQUE

Easily grown from fresh seed. Seed may take up to 2 years to germinate. Can be grown from hard-wood cuttings but rather slow to strike.

## THREATS

Not Threatened, although as a forest-type it has been greatly reduced through widespread logging. Very few intact examples of matai-dominated forest remain in the country.

## ETYMOLOGY

**prumnopitys**: From the Greek prymnos ‘hindmost’ or ‘stern’ and pitys ‘pine’, referring to the location of the resin duct

## WHERE TO BUY

Commonly cultivated and frequently sold by most commercial nurseries and outlets—usually from plants raised from seed, however some nurseries stock cutting grown plants raised from adult foliage, thus bypassing the filiramulate, divaricating juvenile growth-form. A very popular garden tree.

## CULTURAL USE

Gum from the trunk is the basis for “matai beer”, a deep, rich brew still made in some parts of the country. The dark, hard, durable timber is much sought after for floors and furniture.
