All other rights reserved.

#### Introduction

This book was compiled from information stored on the website of the New Zealand Plant Conservation Network (www.nzpcn.org.nz).

This website was established in 2003 as a repository for information about New Zealand's threatened vascular plants. Since then it has grown into a national database of information about all plants in the New Zealand botanic region including both native and naturalised vascular plants, threatened mosses, liverworts and fungi.

Funding to develop the website was provided by the New Zealand Government's Terrestrial and Freshwater Biodiversity Information System Programme (TFBIS).

The species information used on the website has come from a variety of sources. The indigenous vascular plant text was written largely by Dr Peter de Lange (former Network Vice President). Peter based the descriptions on a wide range of sources including the Flora of NZ Series (Allan 1961, Moore and Edgar 1970 and Webb et al 1987) as well as numerous other taxonomic treatments. For a full bibliography of information sources see the References at the end of this book.

Where no published treatment was available Peter used herbarium specimens and his own knowledge of the flora to prepare species pages. Various other contributors have provided text and additional information to many species pages including botanists such as Mike Thorsen, John Barkla, Cathy Jones, Simon Walls, Nick Singers and many others. The threatened fungi text was written by Eric Mackenzie and Peter Buchanan (Landcare Research).

More than 200 photographers have kindly provided images to illustrate the website and for use in this book especially John Smith-Dodsworth, Jeremy Rolfe, Peter de Lange, Wayne Bennett and Gillian Crowcroft.

#### The New Zealand Botanic Region

The information on the Network website, from which this book was compiled, is for species that are indigenous to or naturalised within the New Zealand Botanic Region as defined by Allan (1961). The New Zealand botanic region encompases the Kermadec, Manawatawhi/Three Kings, North, South, Stewart Island/Rakiura, Chatham, Antipodes, Bounties, Snares, Auckland Campbell island/Motu Ihupuku and Macquarie.

#### **About the Network**

The Network has more than 800 members worldwide and is New Zealand's largest non-governmental organisation solely devoted to the protection and restoration of New Zealand's indigenous plant life.

The vision of the New Zealand Plant Conservation Network is that 'no indigenous species of plant will become extinct nor be placed at risk of extinction as a result of human action or indifference, and that the rich, diverse and unique plant life of New Zealand will be recognised, cherished and restored'.

Since it was founded in 2003 the Network has undertaken a range of conservation initiatives in order to achieve its vision.

That work has included:

- Training people in plant conservation
- Publishing plant books, reports and posters
- Raising money for the David Given Threatened Plant Research Trust to pay for plant conservation research scholarships
- Advocacy to raise awareness of the importance of plant life in general and especially New Zealand's status as a Global Centre of Plant Diversity
- Lobbying central and regional government and business to protect indigenous plant life
- Educating people about plant life through the Network website
- Connecting people through the monthly newsletter, the Network conference and the annual general meeting

# What is a threatened plant?

The NZ Threatened Plant Committee was formed in 1991 and ever since then it has met at regular intervals to review the status of indigenous vascular plants. It is made up of a small group of botanists that between them have an extensive knowledge of the native plants of New Zealand. This group is chaired by Dr Peter de Lange of the New Zealand Department of Conservation.

This committee applies a set of criteria to each native plant to determine its conservation status. The resulting list of species classified as threatened is published in the NZ Journal of Botany (see for example de Lange et al. 2009). The main threat categories used are: Extinct, Critical, Endangered, Vulnerable, Declining. Other categories used are: Recovering, Relict, Naturally Uncommon, Coloniser, Vagrant and Data Deficient. For vascular plants the threat status used in this book is taken from the 2009 conservation assessment (see de Lange et al 2009).

More recently other committees have been established to review the status of non-vascular plants but their lists are yet to be published.

# Cortaderia jubata

#### **Common Name(s):**

purple pampas grass

# **Current Threat Status (2009):**

**Exotic** 

#### **Habitat:**

Terrestrial. Forest light gaps, slips, margins, disturbed sites, open habitats, riverbeds, cliffs, inshore and offshore islands, tussockland, fernland, herbfield, duneland, coastline, gumlands, salt marsh, estuaries, shrublands.

#### **Features:**

Large-clump-forming grass to 3 m+. Leaf base very hairy, no white waxy surface. Leaves with conspicuous midrib which does not continue into leaf base, no secondary veins between midrib and leaf edge. Both leaf surfaces dark green, snap readily when tugged. Dead leaf bases spiral like wood shavings. Flowerhead erect, dense, uniform, fluffy, bright purple, fading to dirty brown, Jan- Mar.

#### Flowering:

January, February, March

#### Fruiting:

March-April (Timmins & MacKenzie 1995).

**Photographer:** Jeremy Rolfe

# Cortaderia selloana

#### **Common Name(s):**

pampas grass

# **Current Threat Status (2009):**

**Exotic** 

#### **Habitat:**

Terrestrial. A coastal and lowland plant found between sea level and 800 metres. Plant grows in sites of all levels of fertility from low to high. The plant grows in a wide variety of soils from pumice and coastal sands to heavy clay (Ford 1993). Coloniser of open ground (West, 1996). A plant that occurs in low or disturbed forest, wetlands, grasslands, scrub, cliffs, coastlines, islands, forest margins, riverbanks, shrubland, open areas, roadsides and sand dunes. The plants primary habitat is disturbed ground.

#### **Features:**

Large-clump-forming grass to 4 m+. Leaf base smooth or sparsely hairy, no white waxy surface. Leaves with conspicuous midrib which does not continue into leaf base, no secondary veins between midrib and leaf edge. Leaves bluish-green above, dark green below, snap readily when tugged. Dead leaf bases spiral like wood shavings. Flowerhead erect, dense, fluffy, white-pinkish, fading to dirty white, (Jan)-Mar-Jun.

Flowering: Fruiting:

March, April, April-May (Timmins & MacKenzie

May 1995).

# Miscanthus nepalensis

#### **Common Name(s):**

Himalayan fairy grass

## **Current Threat Status (2009):**

**Exotic** 

#### **Habitat:**

Terrestrial. Waste areas, spreading from roadsides.

#### **Features:**

Tall tufted perennial grass to about 1 m tall. Culm 40-80 cm, purplegreen to yellow-green with purplish nodes. Leaf-sheath often conspicuously purple, with scattered long silky hairs. Leaf-blade 20-60 cm x 4-10 mm, stiff with obvious pale green mid-rib, gradually tapering, margins rough to the touch. Panicle 10-20 cm, golden brown, drooping fan-shaped. Seed 1-1.5 mm.

Pennisetum purpureum
Common Name(s): Elephant grass
Current Threat Status (2009): Exotic
Habitat: Terrestrial.
<b>Features:</b> Robust tufted perennial grass to 3 m or more, with 6mm rhizome. Leaf blade up to 75 cm by 3 cm, flat with numerous fine appressed hairs. Culm internodes with fine hairs for some distance below inflorescence. Panicle 14 by 2 cm, cylindric and spike-like.

# **Definitions of botanical terms**

Bifurcate

Divided into two.

A glossary has been provided below with definitions for many of the botanical terms used in the species descriptions.

Glossary	D. C
Term	Definition Control of the Control of
Abaxial	Facing away from the stem of a plant (especially denoting the lower surface of a leaf).
Acerose	Narrow with a sharp stiff point.
Achene	A simple, dry, one-seeded (one-celled) fruit
Acicular	Needle-shaped.
Acidic	Having a low pH, opposite of basic or alkaline.
Acroscopic	Pointing towards, or on the side of, the apex
Acuminate Acute	Gradually tapered to a point. Sharply pointed.
Acute Adnate	Pointed or sharp, tapering to a point with straight sides.
Adventive	Fusion of unlike parts, e.g. stamens fused to petals.
Agglutinated	A plant that grows in the wild in New Zealand but which was introduced to the country by humans.  Stuck together.
Allelopath	An organism that releases compounds that are toxic to other species.
Allelopathy	The release by an organism of compounds that are toxic to other species.
Alternate	Attached singly at each node but changing from one side of a stem to the other.
Alveolate	Honeycombed with ridged partitions.
	•
Amplexicaul Anamorph	clasping or surrounding the stem  Asexual fruiting stage, usually of an ascomycete fungus.
Anastomosing	Rejoining after branching, as in some leaf veins.
Annual	A plant that completes its complete life cycle within the space of a year
Annual	Plants that lose their over-wintering leaves rapidly in the first half of the growing season. Annual evergreens never present
evergreen	leafless appearance, but are closer in a functional sense to a deciduous plant than they are to multi-annual evergreens.
Annulus	Line of thickened cells that governs the release of spores from a sporangium  Towards the front.
Anterior	
Anther Antheridium	The pollen-bearing portion of the stamen.
Antherialam	Male reproductive organ formed on the prothallus of a fern  When the flavor is fully developed and functioning. The time of pollination on bloom
	When the flower is fully developed and functioning. The time of pollination or bloom.
Apex	Tip; the point furthest from the point of attachment.  Plural of apex. Tip, the point furthest from the point of attachment
Apices Apiculate	Bearing a short slender and flexible point.
Apiculate Apiculus	A small, slender point.
Apomixis	A form of reproduction whereby seed is formed without the usual mode of sexual fusion
Appressed	Pressed against another organ or surface.
Appressed Aquatic	Growing, or living in, or frequenting water. Applied to plants and animals and their habitats. Opposite of terrestrial (land
	living).
Archegonium	Female reproductive organ of a fern formed on the prothallus
Arcuate	Curved into an arch.
Aril	An often fleshy appendage on the outside of a seed.
Artificial thinning	Selectively removing vegetation to create gaps to facilitate natural invasion of native plants, or to plant later successional plants.
Ascending	Growing obliquely upward.
Asexual	Vegetative reproduction, lacking sexual involvement by sperm or egg cells
Attenuate	Narrowing gradually
Auricle	A small, ear-shaped appendage.
Auriculate	Bearing a small, ear-shaped appendage.
Autogamous	Self-fertilising flowers.
Autotrophic	Of or relating to organisms (as green plants) that can make complex organic nutritive compounds from simple inorganic sources by photosynthesis
awn	A stiff or bristle like projection often from the tip or back of an organ
Axil	The upper angle between the leaf and the stem.
Axis	The longitudinal supporting structure around which organs are borne, e.g., a stem bearing leaves.
Barbellate	Barbed, having or covered with protective barbs or quills or spines or thorns or setae
Basal	At the base.
Basiscopic	Pointing towards the base
Beak	A prominent extension of an organ
Bifid	Deeply split into two lobes.

**Definition** Term **Biosecurity** Preventing, eradicating, controlling and managing risks posed by pests and diseases. **Biotic** Pertaining to the living parts of the environment **Bipinnate** With each primary pinna divided to the midrib into a secondary pinna **Biserrate** Doubly serrate. Blade The flattened part of a leaf. Not pointed at the ends Blunt A quagmire covered with specialised plants including sphagnum moss, grasses, sedges, rushes, sundews, umbrella ferns and Bog other plants; has wet, spongy ground, a marsh-plant community on wet, very acid peat. Fed only by rainfall. A genetic term; refers to the fact that in smaller populations there could be lower genetic variability **Bottleneck** Brachyblasts Short shoots A reduced leaf or leaf-like structure at the base of a flower. Bract Bearing bracts: leaves or leaf-like structure reduced at the base of a flower. **Bracteate** Bracteolate With small bracts. Bracteole A small bract. **Bracteoles** Bracts directly below the flower **Brevideciduous** Brief (1 month or less) loss of most leaves from the canopy just before flowering or during flushing of a new cohort of leaves. **Bryophyte** Plant group including mosses, liverworts and hornworts **Bryophytes** Plant group including mosses, liverworts and hornworts **Bulbil** A bud produced vegetatively on the stem or frond that is capable of breaking of and growing into a new plant **Bullate** With rounded projections covering the surface as if blistered Caespitose Growing in dense tufts Calli Circular, warty, stalked thickenings commonly found on the lip (labellum) of the orchid (plural of callus). **Callose** Hardened or thickened. Callus Stalked thickening on the lip (labellum) of an orchid. The group of sepals, or outer floral leaves, of a flower Calyx Campanulate Bell-shaped. Canaliculate With longitudinal channels or grooves. The uppermost cover formed by the branches and leaves of trees or the spread of bushes, shrubs and ground covers. Canopy Canopy closure Stage where canopies of shrub and tree species meet. Selectively removing vegetation to create gaps to facilitate natural invasion of native plants, or to plant later successional Canopy manipulation plants. Capillary Hair-like Capitula Plural of capitulum: A dense head-like inflorescence of many flowers as occurs in most Asteraceae (daisies) Capitulum A dense head-like inflorescence of many flowers as occurs in most Asteraceae (daisies) A dry fruit formed from two or more fused carpels that splits open when ripe. Capsule Carbon sinks Carbon locked away, or sequestered e.g. by trees Carpel One unit of the female part of a flower that consists of a basal seed-bearing ovary joined to a receptive stigma by a stalk-like style. Cauda Tail-like appendage. (pl. caudae; adj. caudate) Caudex The axis of a woody plant, esp. a palm or tree fern, comprising the stem and root. Cauline Belonging to the stem, as in cauline leaves emerging from the stem. Cerise Bright or deep red. Chartaceous Having a papery texture. Chlorophyll The green pigment of plants. Chlorotic Lacking chlorophyll, therefore yellowish, suffering from chlorosis. Cilia Short small hair-like structures on a cell or microorganism Ciliate With small hairs (cilia). Ciliolate Diminutive of ciliate, i.e., having very small hairs Cladode Flattened stem with the function of a leaf Cladodes Usually flattened, photosynthetically active branches, these may be leaf-like (e.g., Phyllocladus) or branch-like (e.g., Carmichaelia) Clavate Club-shaped, gradually widening towards apex. Cleft Having indentations that extend about halfway to the center, as in certain leaves. Cleistogamous Flowers that self-fertilise without opening. Coherent Sticking together of like parts.

Stamen and stigmas fused to form a single organ.

Column

**Definition** Term Columnar Shaped like a column many small flowers tightly packed together e.g., daisy flowers. Composite Composed of several similar parts (cf simple) Compound Curved inward. Concave Concolorous Of the same colour. Conical Cone-shaped. Connate Fusion of like parts. Conspecific Individuals of the same species. Cordate Heart-shaped with the notch at the base. Coriaceous Leather-like; thick, tough, and somewhat rigid. Corolla The whorl of petals of a flower. Modified raceme where stalks of lower flowers are elongated to same level as the upper flowers. Corymb Cosmopolitan A species or other taxonomic group that is distributed widely throughout the world. Costa The midrib Crenate With rounded teeth (bluntly toothed) along the margin. Margin tightly wavy or crinkled, curled or wavy. Crisped Cristate With a crest. Crown The growing point of an upright rhizome or trunk. This usually produces a tuft or ring of fronds. Crura The two small projections at the mouth of a utricle in Carex Cucullate Hood-shaped. Culm The erect stem of a grass. Cuneate Wedge-shaped. Cupular Cup-shaped. Cuttings Stems and/or leaves taken from plants for propagation Cyathium A cup-like structure that surrounds the inflorescence in Euphorbia Inflorescence at the terminus of a branch and where new flowering branches emerge laterally below the flower. Cyme Populations (or infraspecific taxa) that differ in chromosome number or chromosome morphology, e.g., Nematoceras trilobum Cytorace agg. has two cytoraces, a diploid and a tetraploid (in which the chromosomes are doubled). Populations (or infraspecific taxa) that differ in chromosome number or chromosome morphology, e.g., Nematoceras trilobum Cytotype agg. has two cytotypes, a diploid and a tetraploid (in which the chromosomes are doubled). Deciduous Marked leaflessness in winter, and greater than 90% leaves lost by beginning of spring flush. Decrescent Diminishing. Decumbent With a prostrate or curved base and an erect or ascending tip. **Decurrent** Attached by a broadened base. Decurved Curved downward. **Deflexed** Bent abruptly downward. The time of opening at maturity to release the contents, e.g., a capsule releasing the seeds. Dehiscence **Dehiscent** Splitting open at maturity to release contents (of a fruit). Deltoid Shaped broadly like an equilateral triangle. **Dentate** Toothed along the margin with the teeth pointing outward, not forward. **Denticles** minute teeth **Denticulate** having a very finely toothed margin **Dichotomous** Divided into two equal branches. Digitiform Finger-like. Dioecious Having male and female flowers on separate plants of the same species. Diploid With two complete sets of chromosomes in each cell. Disarticulating Separating at a joint. Discoid Disc-shaped. Disjunct A species or other taxonomic group that occupies areas that are widely separated and scattered and therefore have a discontinuous distribution. Distal Toward the apex, away from the point of attachment (cf. proximal). **Distichous** In two rows on opposite sides of the axis. Divaricating Branching at a very wide angle with stiff intertwined stems. small structures on the lower surface of a leaf in some woody dicotyledons, located in the axils of the primary veins and usually Domatia consisting of depressions partly enclosed by leaf tissue or hairs.

Term **Definition** Dorsal Of the back or outer surface relative to the axis. (cf. ventral) A stone fruit, the seed enclosed in a bony covering (endocarp) which is surrounded by a + fleshy layer (mesocarp) Drupe Early successional Plants which are able to colonise an open area after disturbance but which are often temporary and are replaced by taller species plants in time and shaded out. having sharply pointed spines or bristles. **Echinate Ecological district** A characteristic landscape and biological community defined in the PNA (Protected Natural Area) programme. **Ecological** Attempt to reinstate original (pre-disturbance) state of a habitat, plant community or ecosystem. restoration **Ecosourced** Plants sourced from seed collected from similar naturally growing plants in the area of the planting site. Using native plants grown from locally grown seeds. Eco-sourced plants help to preserve the ecological distinctiveness of an **Ecosourcing** area, and ecosourced plants fare better and are adapted to survive in the local conditions. Eglandular Without glands. Elaiosome Fleshy, oil-rich structure attached to seed that attracts ants which act as dispersers. Elliptic in long section and circular in cross-section. **Ellipsoid Elliptic** Broadest at the middle With a notch at the apex. **Emarginate Emarginated** Having a shallow notch at the tip, as in some petals and leaves. **Emergent** In an aquatic sense - wetland herbs that are rooted in the substrate below water level, but carry leaves and stems above the water level e.g. rushes and raupo. Found on the shallow margins of lakes, ponds and waterways. In a forest sense - tree that is appearing above the surrounding canopy. **Emergent** An aquatic plant having most of its structure above water. Other aquatic plants are submerged or floating. marginals **Endemic** Unique or confined to a place or region, found naturally nowhere else. **Endophyte** An endosymbiont (usually a bacterium or fungus) that lives within a plant for at least part of its life without causing any apparent disease. Endosymbionts (usually bacteria or fungi) that live within plants for at least part of their lives without causing any **Endophytes** apparent disease. **Endosperm** The nutritive tissue of a seed, consisting of carbohydrates, proteins, and lipids. **Enrichment** Returning to a revegetation site and creating gaps, or filling existing gaps, with different plants of plants, usually later planting successional plants which may not have survived being planted in the first phases of the project. **Ensiform** Sword shaped Entire Smooth. Without teeth, notches or divisions. **Entomophilous** Pollinated by insects. Calyx-like structure outside, but close to, the true calyx. **Epicalyx Epigeal** Growing on or close to the ground or emerging from the ground after germination (often used for cotyledons). A plant that grows upon another plant but is not parasitic and does not draw nourishment from it. **Epiphyte Epiphytic** Growing upon another plant but not parasitic and not drawing nourishment it Irregularly toothed, as if gnawed. **Erose Estuarine** Pertaining to the meeting of freshwater and seawater wetlands. Ethnobotany The study of people's classification, management and use of plants. Eusporangia Sporangia that arise from groups of epidermal cells **Evanescent** Lasting a very short time or running a short distance. Ex situ Away from the place of natural occurrence. Ex-situ Maintenance of plants as live specimens or propagules in cultivation as insurance against the loss of wild populations and as source for material for translocation. Excurrent Having the axis prolonged to form an undivided main stem or trunk (as in conifers). Extravaginal Outside an enclosing sheath **Falcate** Hooked or curved like a sickle. **Fastigiate** Branches erect and close to central axis. Fen A type of wet land that accumulates peat deposits. Fens are less acidic than bogs, deriving most of their water from groundwater rich in calcium and magnesium. **Ferrugineous** Rust-like (a colour term) Fertile frond Fronds that bear sporangia. **Filamentous** Resembling a filament. Filiform Thread like, resembling a filament. **Filiramulate** Branching at a very wide angle with stiff intertwined stems. Fimbriae Plural of fimbria: Fringe. A fimbria is composed of many fimbrillae (individual hair-like structures). fimbriate With fringes. Flabellate Fan shaped. Flaccid Limp, not rigid, flabby. Flange A projecting rim.

**Definition** Term Flexuose With curves or bends. Having tufts of soft woolly hairs Floccose Floret A small flower, usually one of a cluster - the head of a daisy for example. Foliaceous Leaf-like. **Foliolate** Having leaflets. Founder effect When a small number of plants (and therefore their genes) from a larger population are selected some genetic information is Frond A leaf, the complete leaf of a fern including the stipe and lamina **Fulvous** Orange-yellow. **Funneliform** Funnel-shaped. **Fusiform** Broadest near the middle and tapering toward both ends. Galea Helmet- or hood-shaped. Galeate Shaped like a helmet or hood. Gametophyte A plant that produces sperm and egg cells and in which sexual reproduction takes place - in ferns this is known as the prothallus Gene pool The mixture of all genes and gene variations of a group or population. Genetic The variety of genes in a plants or populations. diversity Genetic Differences displayed by individuals within a plant which may be favoured or eliminated by selection. variation abrubtly bent geniculate A taxonomic rank of closely related forms that is further subdivided in to species (plural = genera). In a scientific name (e.g., Genus Sicyos australis), the first word is the genus, the second the species. Gibbous Swollen or enlarged on one side, as in a gibbous moon. Glabrescent Lacking hair or a similar growth or tending to become hairless Glabrous Without or devoid of hairs, smooth. Gland A structure that secretes a sticky or oily substance. Glandular A structure that secretes a sticky or oily substance. Glaucous Covered with a fine, waxy, removable powder that imparts a white or bluish cast to the surface. Gley A soil prone to seasonal inundation. Globose Globe-shaped. Glume One of two bracts at the base of a grass spikelet. Groundwater is the water beneath the surface that can be collected with wells, tunnels, or drainage galleries, or that flows Groundwater naturally to the earth's surface via seeps or springs. Groundwater is the water that is pumped by wells and flows out through **Gymnosperm** Plants in the class Gymnospermae that have seeds which are not enclosed in an ovary. **Gynodioecious** A species population containing plants that produce bisexual (perfect) flowers, and plants that produce only female (pistillate) The female reproductive organs of a flower; the pistil or pistils considered as a group. Means literally "womans house" i.e., the **Gynoecium** overall structure that contains the female sex organs Hastate Spear like. Shaped like an arrowhead, but with basal lobes pointing outward rather than downward. Haustorium The absorbing organ of a parasite or hemiparasite Hemi-parasite Obtains water and nutrients from the roots of other plants but also manufactures food through photosynthesis. Hemi-parasitic Obtaining water and nutrients from the roots of other plants then manufacturing food through photosynthesis. The place where collections of dried/pressed plants are kept. Herbarium **Hermaphrodite** Having both male and female sexual characteristics and organs. Heteroblastic Exhibiting differences in leaf shapes or forms in juvenile and adult phases of the plant. Heteroblasty The state of being heteroblastic (i.e., exhibiting differences in leaf shapes or forms in juvenile and adult phases of the plant). Hirsute Hairy. Hyaline Membranous, thin and translucent. An individual that is the offspring of a cross between two different varieties or species. Hybrid Hybridise Breeding with a member of a different plant or type. Hydrophyte A plant species adapted to growing in or on water or in wet situations. Aquatic or semi-aquatic. Hymenium The fertile, spore-bearing layer of a fruitbody. A ring-like, cup-shaped, or tubular structure of a flower on which the sepals, petals, and stamens are borne. Hypanthium **Imbricate** Overlapping. imbricating Overlapping. **Imparipinnate** Odd-pinnate, a leaf shape; pinnate with a single leaflet at the apex. In-situ On site conservation relating to the maintenance of plants in the wild. Inbreeding Genetic similarity in offspring of closely related individuals.

**Definition** Term Incoherent Not sticking together. Incursion Entrance of a pest into an area where it is not present Indumentum A covering of fine hairs (or sometimes scales) Plural of indusium, a membrane covering a sorus of a fern Indusia Indusium A thin tissue that covers the sorus in many ferns. Plural: indusia. Inflorescence The arrangement of flowers on the stem. A flower head. Infundibuliform Funnel-like. The space between the keel and the leaf blade Interkeel The part of an axis between two nodes; the section of the stem between leaves. Internode **Internodes** Part of a stem between two nodes. Within or near the margin. Intramarginal Involucral The scales surrounding the flower head or capitula. bracts Involucre A group of bracts surrounding a flower head. **Involute** With margins rolled inward toward the upper side. **Irritable** Responding to touch. Jugate Paired. Juvenile A plant of non-reproducing size. Keel A prominent or obvious longitudinal ridge (as in a boat). Labellar Pertaining to the labellum: a lip; in orchid flowers referring to the middle petal which usually differs in size, shape or ornamentation from the two lateral petals. Labellum A lip; in orchid flowers referring to the highly modified middle petal which usually differs in size, shape or ornamentation from the two lateral petals. Lacinia A jagged lobe. Laciniae Jagged lobes. Laciniate Cut into narrow, irregular lobes or segments. Lacustrine Of or having to do with a lake, of, relating to, or formed in lakes, growing or living in lakes. Lamina The expanded flattened portion or blade of a leaf, fern frond or petal. Lance-shaped; of a leaf several times longer than wide with greatest width about one third from the base, tapering gradually Lanceolate to apex and more rapidly to base Lateral On or at the side. Lax With parts open and spreading, not compact. Laxly With parts open and spreading, not compact Leaflet One section of a compound leaf. The lower of two bracts enclosing the flower in grasses. Lemma Bark that is covered in fine lenticles (breathing pores) Lenticillate Ligulate Strap-like, tongue-shaped The membrane between the leaf and the stem of a grass; the "petal" of a ray floret in a composite inflorescence Ligule Linear Long and narrow with more or less parallel sides. Littoral Occurring at the border of land and sea (or lake). On or pertaining to the shore. The shallow sunlit waters near the shore to the depth at which rooted plants stop growing. Lobe A recognisable, but not separated, rounded division or segment of a leaf or pinna. Used to describe ferns and leaves in Cotula and Leptinella. Lobed Part of a leaf (or other organ), often rounded, formed by incisions to about halfway to the midrib. A small lobe or sub-division of a lobe Lobule Lustrous Glossy, shiny. Lycophytes Seedless vascular plants that belong to the phylum Lycophyta (characterised by microphylls -primitive leaves found in ancient plants). Lyrate Pinnatifid or pinnatisect terminal lobe much larger than lower lobes. Maculate Blotched or spotted. Coastal wetland dominated by Manawa or mangrove Avicennia marina var. resiifera. Northern New Zealand only, salt **Mangrove** marsh replaces it further south. Margin The edge or border of a leaf Marine Pertaining to the sea and saltwater systems. Marsh A tract of wet land principally inhabited by partially-submerged herbaceous vegetation. Has fewer woody plants than swampier habitats. Mealv Dry, powdery, crumbly. Median In the middle. Membranous Very thin, like a membrane. Mid-lobe The middle part into which a leaf is divided. Midrib The central or principal vein of a leaf or pinna of a fern. Mire Synonymous with any peat-accumulating wetland. Term covers bogs and peaty swamps, fens, carr, moor, muskeg and peatland. Term excludes marsh which is non-peat forming.

**Definition** Term Molecular Where proteins and genes are used to investigate plant relationships techniques Monitoring Recording of quantitative data over time to document changes in condition or state of species or ecosystems. Having male and female flowers on the same plant of the same species. Monoecious Montane Land between 300 and 800 metres above sea level. Tipped with a short, sharp, point. Mucronate Mucronulate Having a very small mucro; diminutive of mucronate. Multi-annual Overlapping annual cohorts of leaves always present. evergreen Multifid Cleft into many lobes or segments Multiseptate With many septa. Mycorrhiza A symbiotic relationship between a fungus and a plant. **Mycorrhizal** Symbiotic association between fungi and plant roots which assists plant health by allowing increased ability for uptake of associations nutrients and promote plant growth. **Napiform** A long swollen but tapering root – like a parsnip, or carrot. Native Naturally occurring in New Zealand (i.e., not introduced accidentally or deliberately by humans). Referring to plants that have escaped from cultivation (including gardens or forest plantations) and can now reproduce in the naturalised wild (without human assistance) Nectary Organ that produces nectar. Prominent vein or rib. Nerve Strands of conducting and usually strengthening tissue in a leaves or similar structures Nerves **Net veins** Veins that repeatedly divide and re-unite. Net venation Feather-like or hand-like venation on a leaf. Nival Growing at high altitudes. From Latin: nivalis, snowy etc. from nix, nivis, snow. Node The point at which leaves, branches or roots arise on a stem. Ob-Prefix meaning inverted, in reverse direction. **Obcordate** Heart shaped with the notch at the apex. Oblanceolate Tapering and widest towards the apex or inversely lanceolate. **Oblique** Slanting; of a leaf, larger on one side of the midrib than the other, in other words asymmetrical. **Oblong** Rectangular. **Obovate** Roughly elliptical or reverse egg shaped and widdest near the apex (i.e., the terminal half broader than the basal half). **Obtuse** Blunt or rounded at the apex, with the sides meeting at an angle greater than 90°. Operculate With a small lid. **Opposite** A pair of organs attached at nodes in pairs on either side of a stem or axis. Orbicular Almost or approximately circular. Outbreeding A reduction in vigor of offspring from distant parents. It can occur when a locally adapted population is moved and mixed depression with plants adapted to different conditions. Outer canopy Marked reduction in leaf number in the outer canopy in exposed high light environments over winter. deciduous Planar, shaped like a flattened circle, symmetrical about both the long and the short axis; about twice as long as broad, Oval tapering equally both to the tip and the base. Synonymous with elliptical. Ovary Part of a flower containing the ovules and later the seeds. Ovate Egg-shaped and widest at base. Ovoid Oval; egg-shaped, with rounded base and apex. A term which in its strict sense refers to open clears within forest dominated by low scrub and rushes. However, more usually Pakihi used to refer natural and induced wetlands and their associated shrublands. A vernacular most frequently used in the West Coast for impoverished soils and their associated peats, left after forest has been cleared Palea The small upper bract enclosing the flower of a grass **Palmately** Radiating from a point, as fingers radiating from the palm of a hand. **Palmatifid** Deeply divided into several lobes arising from more or less the same level. **Palmatisect** Intermediate between palmate and palmatifid, i.e. the segments are not fully separated at the base; often more or less digitate. **Palustrine** Pertaining to wet or marshy habitats. Term covers mires and marshes Pandurate Fiddle-shaped. **Panicle** Highly branched (multiple raceme). **Papilla** A short rounded projection. **Papillae** A soft, fleshy projection, usually small and nipple-like. **Papillate** With short rounded projections. **Papillose** Warty, with short rounded projections or gland-dotted Parallel Veins are parallel along leaf. venation

Term **Definition Parasite** An organism that derives all its nourishment from its host. Patent Spreading or expanded, e.g., spreading petals. A mass of partially carbonised plant tissue formed by partial decomposition in water of various plants and especially of mosses Peat of the genus Sphagnum, widely found in many parts of the world, varying in consistency from a turf to a slime used as a fertiliser, as stable litter, as a fuel, and for making charcoal. Partially carbonized vegetable matter saturated with water; can be used as a fuel when dried. A type of soil deriving from dead organic material situated in a wet area, where the reduced amount of [[oxygen available in the wet conditions results in the organic material not decomposing as much as it usually would do so in the presence of more oxygen. Used in growing media. Represents an important carbon sink -drainage of peat releases large amounts of carbon (CO2) to the atmosphere. Pedicel The stalk of a single flower in an inflorescence or fruit (either in a cluster or existing singularly). Peduncle The stalk of a solitary flower or the main stalk of an inflorescence or flower cluster. **Pedunculate** Describing fruits, which are borne on a stalk (a peduncle). Pellucid Transparent. **Peltate** Shield-like, with the stalk attached well inside the margin Pendent Hanging down from its support Pendulous Hanging or drooping. Penicillate With a tuft of hairs at the end, like a brush. **Perennial** A plant lasting for three seasons or more Perianth A collective term for the calyx (sepals or tepals) and corolla (petals) of the flower, especially when these are indistinguishable Petal Part of flower inside the sepals; usually coloured. Petiolate Having a petiole. Petiole Leaf stalk. The vascular tissue in land plants that is primarily responsible for the distribution of sugars and nutrients manufactured in a phloem shoot. **Photopoint** A monitoring technique where repeat photos are taken of the same scene from the same point over a period of time in order to quantify changes. **Pilose** Bearing long, soft hairs. Pinna A segment of a divided lamina that is classified as primary, secondary or tertiary according to the degree of dissection of the lamina. Pinnae Divisions of a pinnate leaf **Pinnate** With leaflets arranged regularly in two rows on either side of a stalk as in a feather; the lamina on a fern is divided into separate pinnae **Pinnatifid** Pinnately lobed, cleft more than halfway to the midrib. Not cleft all the way to the rachis. Pinnatisect Pinnately divided almost to midrib but segments still confluent. Plant species are hardy species that should be planted first to establish a good canopy cover that restricts weed growth and **Pioneer** promotes natural regeneration. In natural ecosystems these are the first plants to arrive and grow on a site. **Pistil** The female reproductive organ of a flower, consisting of an ovary, style, and stigma. **Pistillate** A flower with one or more pistils, but no stamens. Plano-convex Flat on one side, convex on the other. Plumose Feathery. **Podzol** Infertile, acidic soil, strongly leached to form a whitish-grey subsoil underlain by a layer enriched in iron, aluminium and organic matter; usually under forest in a wet temperate climate. Pole A subcanopy size individual with a long thin trunk and foliage tuft of a potential canopy tree. Pollinia Compact masses of orchid pollen. **Population** Increasing a population for a specific biological purpose, e.g., when a species is already present in an area but extra individuals enhancement are added to address a sex imbalance. Extending forward. **Porrect** Lying and flat along the ground but not rooting **Procumbent Propagate** To reproduce a plant by sexual (i.e., from seed) or asexual (e.g., from cuttings) means. A general term for lying flat along the ground. This includes procumbent (that is lying and flat along the ground but not Prostrate rooting) and decumbent (with a prostrate or curved base and an erect or ascending tip). Provenance The place of origin (of a plant that is in cultivation). **Proximal** Toward the base or point of attachment (cf. distal). **Pseudobulb** Thickened surface stem; usually looking like a bulb. **Pseudoterminal** Falsely terminal - as in a bud which appears to occupy a terminal position but does not **Puberulent** Minutely clad in short, soft hairs **Pubescence** Covering of soft, fine hairs **Pubescent** Covered in short, soft hairs. Ending in a stiff sharp point Pungent Pustule Small blister-like elevation.

Term Definition Quadrate Square, rectangular. An unbranched, elongated inflorescence with pedicellate flowers maturing from the bottom upward i.e., flowers attached to the Raceme main stem by short stalks. Rachis the axis of an inflorescence or of a compound leaf Rav An outer ring of strap-like florets in the head of Asteraceae (daisy) flowers. Translocating wild or cultivated individuals to sites where the taxon has been known to occur in the past, but from which it has Reintroduction disappeared. Recurved Curved backward. Reflexed Bent back on itself Reniform Kidney shaped. Repand With a slightly wavy margin. Replum The outer structure of a pod in which the valves have dehisced (persists after the opening of the fruit) Area dominated by rush-like plants (collectively known as restiads) of the family Restionaceae. Includes Chatham Island and Restiad North Island Sporodanthus and oioi (Apodasmia similis) Retrorse Pointing backward. Retuse A shallow notch at the rounded or blunt apex of a leaf. Rhizoid Any of various slender filaments that function as roots in mosses and ferns and fungi. Rhizomatous With underground creeping stems. Rhizome An underground stem (usually spreading horizontallly or creeping) or short and erect. Rhombic Diamond-shaped. Rhomboid Diomond shaped, nearly rhombic. Riparian Relating to or living or located on the bank of a natural watercourse (as a river) or sometimes of a lake or a tidewater. Riparian Refers to the edges of streams, rivers, lakes or other waterways. margin Riparian Refers to plants found growing near the edges of streams, rivers or other waterways. plants Riparian zone A strip of land next to streams, rivers, and lakes where there is a transition from terrestrial (land vegetation) to aquatic (water) vegetation. Also known as "berm". Riverine Pertaining to rivers, streams and such like flowing water systems. Rootstock A short, erect, underground stem. Rosette A radiating cluster of leaves. In orchids, a modified stigma that prevents self-fertilisation. Rostellum Rosulate A dense radiating cluster of leaves. Rugose Wrinkled. Rugulose Having small wrinkles. Runcinate Sharply pinnatifid or cleft, the segments directed downward. Runner A trailing stem that roots at the nodes. Rupestral Growing on rocks. Rushes A group of distinctive wetland plants. They have solid stems (grasses have hollow stems), true rushes Juncus sp. have rounded leaves. Sagittate Shaped like the head of an arrow; narrow and pointed but gradually enlarged at base into two straight lobes directed downwards; may refer only to the base of a leaf with such lobes; cf. hastate. Salt marsh A coastal wetland, with specialized salt tolerant plants (halophytes). Sapling A juvenile tree that has reached the stage of 1 or 2 main stems but is still in the shrub layer. Saprophyte A plant lacking chlorophyll and living on dead organic matter. Saprophytic Lacking chlorophyll and living on dead organic matter. Sarcotesta The fleshy, often highly coloured outer layer of the seed coat in some species, e.g., titoki (Alectryon excelsus). Roughened or rough with delicate and irregular projections. Scabrid Scale Any thin, flat, membranous structure. A leafless flower stem. Scape Scutiform Shield-shaped. Sedges A group of grass-like or rush-like herbaceous plants belonging to the family Cyperaceae. Many species are found in wetlands some are forest floor plants. Leaves are usually angular. Hence the saying "rushes are round and sedges have edges". Seedling A newly germinated plant. Self sustaining Able to sustain itself, or replace itself, independently of management i.e. regenerate naturally Self thinning Natural tree death in a crowded, even-aged forest or shrubland. Semi-Partial leaflessness in winter, and greater than 50% leaves lost by the beginning of spring flush. deciduous Sepal Outer part of flower; usually green. Serrate Sharply toothed with teeth pointing forwards towards apex. Serrulate Finely serrate, i.e., finely toothed with asymmetrical teeth pointing forward; like the cutting edge of a saw.

Term **Definition** Sessile Attached by the base without a stalk or stem. Seta The stalk of a fruiting moss capsule Sheath A portion of an organ that surrounds (at least partly) another organ (e.g., the tubular envelope enclosing the stem in grasses and sedges). Silicles The flattened usually circular capsule - compared with the narrow, elonated fruit (silique) - containing the seed/seeds. A term used almost exclusively for plants within the cabbage family (Brassicaceae) Silique A capsule, usually 2-celled, with 2 valves falling away from a frame (replum) bearing Simple Of one part; undivided (cf compound). **Sinuate** With a wavy margin. Sinus The space or recess between lobes; in hebes a gap between the margins of two leaves of an opposite pair that may be present in the bud before the pair of leaves separate. Sorus A cluster of two or more sporangia on the margin or underside of the lamina of a fern, sometimes protected by an **Spathulate** Spatula or spoon-shaped, a rounded blade tapering gradually to the base. **Spheroidal** Almost spherical but elliptic in cross section. **Spicate** Arranged in a spike. Spike Flowers attached to main stem without stalks. Collection of individual grass florets borne at the end of the smallest branch of the inflorescence. Spikelet **Sporangia** Plural of sporangium. Structures in which spores are produced. **Sporangium** Structure in which spores are produced. A single-celled reproductive unit similar in function to that of the seed in a flowering plant. **Spore** The spore producing plant in ferns that is usually the visible part. sporophyte Stamen The male reproductive organ of a flower where pollen is produced. Consists of an anther and its stalk. The male, pollen bearing organ of a flower. Stamens Standing water Where water lies above the soil surface for much of the year. Stellate Irregularly branched or star shaped. Stigma Female part of the flower that is receptive to pollen, usually found at or near the tip (apical end) of the style where deposited pollen enters the pistil. Stipe The stalk of a frond Stipitate Borne on a stipe or stalk. Stipulate A leaf with stipules. Stipule A scale-like of leaf-like appendage at the base of a petiole, usually paired. Stolon A stem which creeps along the ground, or even underground. **Stoloniferous** Producing stolons Stramineous Chaffy, like straw or straw-colored. Stria A fine line or groove. Striae Fine lines or grooves. Fine longitudinal lines or minute ridges Striate Style The elongated part of the flower between the ovary and the stigma. Sub-A prefix meaning under, somewhat or almost. **Subglabrous** Very slightly, but persistently, hairy. Suborbicular Slightly rounded in outline Substrate The surface upon which an orchid grows. **Subtended** Immediately beneath, occupying a position immediately beneath a structure, i.e., flower subtended by bract Subulate Slender and tapering to a point. Succession Progressive replacement of one species or plant community type by another in an ecosystem. Referring to species, plant communities or habitats that tend to be progressively replaced by another. Successional Succulent Fleshy and juicy. Summer-green Used in New Zealand to indicate herbs or sub-shrubs that die down to a root stock or rhizomatous network. Returning to a revegetation site and creating gaps, or filling existing gaps, with different plants of plants, usually later **Supplementary** planting successional plants which may not have survived being planted in the first phases of the project. Surface water Water present above the substrate or soil surface. Surveillance Regular survey for pests inside operational and managed areas e.g. nurseries, standout areas on parks. Survey Collection of observations on the spatial distribution or presence or absence of species using standardised procedures. Sustainable Land The use of farming practices which are sustainable both financially and environmentally including management of Management nutrient runoff, waste disposal or stock effluent, reducing impacts of nutrients on waterways, preventing erosion and soil loss, and protecting native forest and wetland habitats from stock damage. Low land that is seasonally flooded; has more woody plants than a marsh and better drainage than a bog. They are more **Swamp** fertile and less acidic than bogs because inflowing water brings silt, clay and organic matter. Typical swamp plants include raupo, purei and harakeke (flax). Zonation and succession often leads through manuka to kahikatea swamp forest as soil builds up and drainage improves.

Term Definition **Symbiote** An organism that has an association with organisms of another species whereby the metabolic dependence of the two associates is mutual. **Symbiotic** The relation between two different species of organisms that are interdependent; each gains benefits from the other (see also symbiosis). Sympatric Occupying the same geographical region. Synangia Structures made up of fused sporangia Synonym A botanical name that also applies to the same taxon. The study of taxonomy, phylogenetics, and taxagenetics. **Systematics Tabular** Shaped like a rectangular tablet. Taxa Taxonomic groups. Used to refer to a group at any level e.g., genus, species or subspecies. Taxon A taxonomic group. Used to refer to a group at any level e.g., genus, species or subspecies. The process or science of classifying, naming, and describing organisms **Taxonomy** An individual member of the perianth. **Tepal** Cylindrical and tapering. Terete Terminal At the tip or apex. **Ternatifid** Leaflets In threes, **Tetrad** A group of four. **Tomentum** A hairy covering of short closely matted hairs. Translocation The movement of living organisms from one area to another. Trifid Divided into three. **Trifoliate** Having three leaflets. **Trigonous** Three-angled **Tripinnate** With each secondary pinna divided to the midrib into tertiary pinnae **Triquetrous** Triangular in cross section and acutely angled. **Truncate** With the apex or base squared at the end as if cut off. **Tuberculate** Bearing small swellings. **Tubular** Tube-shaped. turbinate Top-shaped. Turgid Distended through internal pressure Type locality The place or source where a holotype or type specimen was found for a species. Ultramafic A type of dark, usually igneous, rock that is chemically dominated by magnesium and iron-rich minerals, the partially metamorphosed form of which is serpentinite. Umbel Umbrella like; the flower stalks arise from one point at the stem. Undulate Wavy edged. Undulose Wavy edged. Unitubular A tube partioned once - literally one tube (compare - multitubular - many tubes) Utricle A thin loose cover enveloping some fruits (eg., Carex, Uncinia) Valvate Opening by valves. Vascular A plant that possesses specialised conducting tissue (xylem and phloem). This includes flowering plants, conifers and ferns but plant excludes mosses, algae, lichens and liverworts. Velutinous Thickly covered with delicate hairs; velvety. Ventral Of the front or inner (adaxial) surface relative to the axis. (cf. dorsal) Vermiform Worm-shaped. Vernicose Glossy, literally as if varnished, e.g., Hebe vernicosa has leafs than appear as if varnished Verrucose Having small rounded warts. Verticillium A fungus disease that will cause wilting and death. **Villous** Covered with long, soft, fine hairs. Water table The level at which water stays in a soil profile. The zone of saturation at the highest average depth during the wettest season. Wetland A site that regularly has areas of open water for part or all of the year, or has a water table within 10 cm of the surface for at least 3 months of the year. Wetland ecosystems support a range of plant and animal species adapted to a aquatic or semi-aquatic environment. Whipcord A shrub in which the leaves are reduced to scales that are close-set and pressed against the stem. Whorl A ring of branches or leaves arising at the same level around the stem of a plant.
