

Carex longifructus

COMMON NAMES

bastard grass, hook sedge

SYNONYMS

Uncinia longifructus (Kük.) Petrie; *Uncinia tenella* var. *longifructus* Kük.

FAMILY

Cyperaceae

AUTHORITY

Carex longifructus (Kük.) K.A.Ford

FLORA CATEGORY

Vascular – Native

ENDEMIC TAXON

Yes

ENDEMIC GENUS

No

ENDEMIC FAMILY

No

STRUCTURAL CLASS

Sedges

NVS CODE

UNCLON

CHROMOSOME NUMBER

2n = 88

CURRENT CONSERVATION STATUS

2017 | At Risk – Naturally Uncommon | Qualifiers: DP, Sp

PREVIOUS CONSERVATION STATUSES

2012 | At Risk – Naturally Uncommon | Qualifiers: DP, Sp

2009 | At Risk – Naturally Uncommon | Qualifiers: DP

2004 | Sparse

DISTRIBUTION

Endemic. North and South Islands. In the North Island known from the Raukumara, Ruahine and Tararua Ranges. In the South Island locally known from Nelson, Marlborough, Westland, Canterbury, North Otago, said to be more common in Fiordland.

HABITAT

A species of shaded slopes and peaty hollows within montane forest and subalpine scrub. Exact habitat preferences are not known.

DETAILED DESCRIPTION

Somewhat flaccid-leaved, openly caespitose, stoloniferous, rather long-spreading sedge. **Stolons** rather fine, < 0.5 mm diameter. **Culms** 30–200 × 0.5 mm, rather rigid, glabrous, basal bracts very light brown or straw coloured. **Leaves** 3–7 per culm, rather flaccid, equal to or < culms, slightly < 1 mm wide, involute to channelled, involute when dry, midrib distinctly thickened and paler, lamina with margins scabrid near leaf apex. **Spike** 10–15 × 2–4 mm, female flowers 5, close-set, internodes 1–1.5 mm long. **Glumes** slightly ≤ length of utricles, deciduous, lanceolate, acute, membranous to chartaceous, midrib pale green. **Utricles** 4.5–5.5 × 1 mm, trigonous with a prominent lateral nerve, or subtrigonous and almost smooth, elliptic-lanceolate, olive-green, spreading when ripe, stipe indistinct, scarcely narrowed, up to 1 mm long, beak tapering, 1.5 mm long.

SIMILAR TAXA

A distinctive species distinguished from other New Zealand hook sedges, by the very narrow tapered leaves, and rather short spikes with relatively long utricles. In Flora II of the New Zealand Flora Series, *Carex longifructus* (as *Uncinia longifructis*) keys out near *C. drucei* (Hamlin) K.A.Ford (as *Uncinia drucei*) from which it differs by its leaves being < 1 mm rather than > 1 mm wide, and by the olive-green rather than dark brown coloured utricles. *Carex drucei* prefers drier forested habitats and rock outcrops than the deep moss, mossy peat shaded habitats preferred by *C. longifructus*. It is also a much less spreading, more shortly stoloniferous plant than *C. longifructus*. Exact relationships amongst the New Zealand hook sedges have yet to be determined, and will almost certainly require a full phylogenetic analysis.

FLOWERING

October–December

FRUITING

October–May

PROPAGATION TECHNIQUE

Unknown. Probably easily grown in a moist, peaty soil.

THREATS

Believed to be a naturally uncommon, ecologically sparse species. However it is poorly known from large parts of its reported range. Further survey to ascertain its exact status is much desired.

ETYMOLOGY

carex: Latin name for a species of sedge, now applied to the whole group.

longifructus: From the Latin longus 'long' and fructus 'fruit'

WHERE TO BUY

Not commercially available.
