

Pterostylis areolata

COMMON NAMES

greenhood

BIOSTATUS

Native

CATEGORY

Vascular

STRUCTURAL CLASS

Orchids

FLOWER COLOURS

Green, White

DETAILED DESCRIPTION

Terrestrial, tuberous, glabrous, spring to summer-green perennial herb, either solitary in forming small patches of 3–8 plants through vegetative extension. Plant at flowering 70–250 mm tall. **Stem** erect, smooth, dark green to reddish green, internodes < leaves. **Leaves** 2–4, with entire margins, shape changing from base to top of stem; lamina 30–90 × 10–25 mm, dark green to yellow-green, the lowest and those of non-flowering plants, broadly elliptic, elliptic, to obovate, apex obtuse to subacute, tapering to a reddish-green broadly winged petiole; uppermost leaves shorter, acute to acuminate; not overtopping the flower. **Flower** solitary, tipping forwards, large, dark green, green striped with white toward the back of the galea. **Ovary** erect. **Dorsal sepal** 30–35 mm tall, mostly erect then sharply horizontal to deflexed, apex shortly acuminate without caudae. **Lateral sepals** diverging at a narrow angle, apices acuminate to shortly caudate, rarely exceeding galea, usually narrowly spreading, decurved. **Petals** slightly shorter than dorsal sepal, very broad, apex acute. **Labellum** basally red, apex often distinctly darker; lamina elliptic, slightly arched, toward a narrowly obtuse, flat or pinched in apex. **Column** mostly taller than labellum; stigma elongate-ovate with a prominent truncate apex.

SIMILAR TAXA

Close to *P. australis* Hook.f. from which it differs by the fewer, consistently wider elliptic to obovate leaves which do not overtop the galea (rather than leaves which grade from the elliptic (rarely broadly elliptic) to almost linear-lanceolate and may or may not overtop the flower); and by the acuminate, only slightly caudate lateral sepals, and elongate-ovate uniformly red stigma. Unlike some southern populations of *P. australis*, the leaves of *P. areolata* are never finely denticulate.

DISTRIBUTION

Endemic. New Zealand: North Island (Taranui Ranges and possibly the Ruahines), South Island (widespread, mainly east of the main divide but also in Nelson and Fiordland).

HABITAT

Lowland to subalpine. In short or tall tussock grassland, grey scrub, on the margins of wetlands and in open forest.

CURRENT CONSERVATION STATUS

2023 | Not Threatened

AUTHORITY

Pterostylis areolata Petrie

SYNONYMS

None

ENDEMIC TAXON

Yes

ENDEMIC GENUS

No

ENDEMIC FAMILY

No

ECOLOGY

FLOWERING

October–November

FRUITING

November–February

PROPAGATION TECHNIQUE

Difficult—should not be removed from the wild. Basic orchid mix consists of 2 parts medium coarse sand, ideally clean river sand; 2 parts soil, humus or leaf-mould; 1 part weathered sawdust or rotting wood; 1 part granulated bark. For *Pterostylis* shade of 50% and pots kept evenly moist.

OTHER INFORMATION

WHERE TO BUY

Not commercially available.

ETYMOLOGY

pterostylis: Winged column

areolata: Netted, with a network pattern between the veins
