

# Carex forsteri

## COMMON NAMES

Forster's sedge

## SYNONYMS

*Carex recurva* Schkuhr; *Carex punctulata* A.Rich.; *Carex semiforsteri* C.B.Clarke

## FAMILY

Cyperaceae

## AUTHORITY

*Carex forsteri* Wahl.

## FLORA CATEGORY

Vascular – Native

## ENDEMIC TAXON

Yes

## ENDEMIC GENUS

No

## ENDEMIC FAMILY

No

## STRUCTURAL CLASS

Sedges

## NVS CODE

CARFOR

## CHROMOSOME NUMBER

2n = 60

## CURRENT CONSERVATION STATUS

2017 | Not Threatened

## PREVIOUS CONSERVATION STATUSES

2012 | Not Threatened

2009 | Not Threatened

2004 | Not Threatened

## DISTRIBUTION

Endemic. New Zealand: North and South Islands. In the North Island common south of Auckland, in the South Island common in Marlborough Sounds and on Banks Peninsula, otherwise sporadic in its occurrences and not recorded from Westland or Fiordland.

## HABITAT

Coastal to montane (rarely subalpine). Usually in dense forest within high rainfall areas where it grows in wet seepages, depressions and along stream banks. A common species of karst country where it is often very conspicuous around sinkholes (tomo) and at cave entrances. Occasionally found around seepages in tall tussock grassland

## DETAILED DESCRIPTION

Large leafy tufts. **Culms** up to 0.9 m tall, 1.0–2.5 mm diameter, trigonous, smooth or occasionally slightly scabrid below inflorescence; basal sheaths dark red-brown. **Leaves** much > culms, up to 1.2 m long, 3–12 mm wide, double-folded, keel and margins scabrid. **Inflorescence** of 4–8 spikes; terminal 1–3 spikes wholly or partly male; remaining spikes female with some male flowers at the base, 25–110 × 5–11 mm, ± distant, ± pedunculate, lowest peduncles often long and slender and spikes drooping, green to grey-green. **Glumes** 2–5 mm. long, lanceolate, gradually tapering to a scabrid awn, membranous, light brown, with a narrow green midrib. **Utricles** = or slightly > glumes, 4–5 × c. 1 mm, subtrigonous, lanceolate, slightly reflexed, turgid towards the base, distinctly many-nerved, greenish brown, gradually tapering to a beak 1.5–2.0 mm long with an oblique, bifid, scabrid orifice. **Stigmas** 3. **Nut** 1.5–2.0 mm long, trigonous, elliptic-obovoid, cream to dark brown.

## SIMILAR TAXA

Easily distinguished from other wide-leaved carices by the absence of cross-veinlets, and long pedunculate spikes whose utricles have an oblique orifice of the utricle. Most likely to be confused with *C. cockayneana* as both grow in similar habitats (though *C. forsteri* is more common at lower elevations) and both have greenish spikes. From *C. forsteri*, *C. cockayneana* differs by the utricles which are shorter, smooth (rather than nerved) and have a shorter beak and straight rather than oblique mouth.

## FLOWERING

September–November

## FRUITING

October–May

## LIFE CYCLE

Nuts surrounded by inflated utricles are dispersed by granivory and wind (Thorsen et al., 2009).

## PROPAGATION TECHNIQUE

Easily grown from fresh seed and by the division of established plants. Excellent for a permanently damp situation in a shaded site where it does best planted within a rich soil.

## ETYMOLOGY

**carex**: Latin name for a species of sedge, now applied to the whole group.
